TITLE: Electric Conductivity and Viscosity of Solutions of Lithium-, Potassium- and Sodium Hydroxide in Water - Acetone Mixtures

PERIODICAL: Zhurnal neorganicheskoy khimii, 1959, Vol 4, Nr 10,
pp 2354 - 2359 (USSR)

ABSTRACT: The effect of a non-aqueous solvent on hydration and migration mechanism of the electric conductivity of alkali hydroxides is investigated. The electric conductivity of electrolytes in water - acetone mixtures was also studied by S. V. Serkov (Ref 5). As can be seen from table 1 and figures 1 and 2, the electric conductivity decreases with increasing acetone content. The conductivities of KOH and NaOH approach to each other at increasing acetone content and increasing temperature, but more slowly than in water - dioxane mixtures. At 50 mole% acetone only the conductivities of NaOH and KOH are equal. The dehydrating property of acetone is less than that of dioxane, accordingly, and the elimination of the migration mechanism is attained more slowly. There are 4 figures, 3 tables, and 7 references, 5 of which are Soviet.

AUTHOR: Godneva, M. M.

TITLE: Electrodeposition of nickel with niobium, tantalum, titanium and zirconium from nonaqueous solutions

SOURCE: Zhurnal neorganicheskoy khimii, v. 9, no. 4, 1964, p. 996-1001

TOPIC TAGS: electrodeposition, alloy electrodeposition, electroplating, nickel, niobium, tantalum, titanium, zirconium, cobalt, nonaqueous electrolyte, zirconium nickel niobium alloy, titanium nickel alloy, zirconium nickel alloy, niobium nickel alloy

ABSTRACT: The possibility of electrodepositing Ni-Nb, Ni-Ta, Ni-Ti, and Ni-Zr alloys from nonaqueous solutions of NiCl_2 and Ta, Ti, Zr or Nb chlorides and certain Nb complex compounds was investigated. No deposits were obtained from alcoholic solutions of NiCl_2 , NbCl_5 , TaCl_5 , TiCl_4 , ZrCl_4 , $\text{ZrOCl}_2 \cdot 8\text{H}_2\text{O}$ taken individually, nor from the solutions of Nb cupferron complex, Nb rhodamite, or Nb hydroxyquinoline complex in alcohol, ether, trichloromethane, carbon tetrachloride, or benzene. Ni can be deposited from alcoholic solutions saturated with dry HCl. Co (containing only about 0.0% Nb) was deposited from an alcoholic solution of Co and Nb chlo-

Card 1/2

L 21768-65

ACCESSION NR: AP4029194

rides with a very low yield. Although Nb will not deposit from an alcoholic solution of NbCl_5 , the addition of even a small amount of NiCl_2 (0.1-0.3 gm./l. NiCl_2 , 40-100 gm./l. NbCl_5) promotes the deposition of Nb-Ni alloys. Ti and Zr similarly do not deposit by themselves but will coprecipitate with Ni from alcoholic solutions containing TiCl_4 or ZrCl_4 with NiCl_2 , at a current density of 0.1-0.3 amp/cm². Ta does not precipitate, even in the presence of NiCl_2 . Neither Zr nor Ni precipitates from $\text{ZrOCl}_2 \cdot 8\text{H}_2\text{O} \cdot \text{NiCl}_2 \cdot \text{C}_2\text{H}_5\text{OH}$ solutions; however an addition of NbCl_5 , an alloy of Zr-Ni-Nb is deposited. Significance of Photosynthetic Activity of the Fruit of Oil Poppy in the Development of Seeds and Oil Accumulation Therein

of chlorophyll approaches that of the leaves. Only from the 17th-18th day after the blossoming, the fruits begin to turn pale and their contents of chlorophyll rapidly decrease. The results obtained by the authors of the present paper (Table Nr 1) show that placing plants in light chambers results in a considerable decrease in the contents of oil. This probably has to be attributed to increased humidity. Weight of the poppy-heads, number of seeds per poppy-head, and weight of the seeds changes only little. Placing of plants in dark chambers resulted in disturbance of the normal development of the poppy-heads. After 5 - 6 days, they lost their green color. Both the number of the fully developed seeds and the absolute weight of the seeds decreased as compared to the control plants. Plants in dark chambers accumulated about 3 % less oil than plants in light chambers. When only the leaves were placed in shadow, with the poppy-heads being exposed to light, numerous seeds remained underdeveloped. The developed seeds were of more less weight and had less than half of the oil content of the control plants. Consequently the main nutrition of the oil-poppy seeds takes

Card 2/3

20-2-58/60

Significance of Photosynthetic Activity of the Fruit of Oil Poppy in the Development of Seeds and Oil Accumulation Therein

place by supply of assimilates from the leaves. If the leaves are placed into shadow, the contents of oil rapidly decrease, whereas they remain almost unchanged if only the fruit is placed into shadow. The decrease of the number of seeds when the poppy-heads are put into shadow indicate that photosynthetic activity through the fruits is of importance for normal development of the plant. There are 2 tables and 9 references, 8 of which are Soviet.

TITLE: Analysis of titanium and thorium sulfides

SOURCE: Zhurnal analiticheskoy khimii, v. 19, no. 8, 1964, 993-996

TOPIC TAGS: titanium sulfide stability, thorium sulfide stability, titanium sulfide analysis, thorium sulfide analysis, thermal stability, oxidation

ABSTRACT: The purpose of this work is to study the oxidizability of titanium and thorium sulfides and to develop a rational method for the chemical analysis of these compounds. A study was made of high temperature oxidation of these sulfides. The stability to oxidation was studied with 270 mesh powder by heating it in an oxygen stream from 300 to 1300°C. The degree of oxidation was determined from the amount of sulfur burned in a definite time interval. Sulfur was determined by absorbing the SO₂ produced in a 3% solution of H₂O₂ and the obtained H₂SO₄ was titrated with 0.1 N NaOH in the presence of methylene red-methylene blue mixed indicator. The titration was

Card 1/3

ACCESSION NR: AP4043463

carried out in the course of combustion and the amount of sulfur combusted was determined after each 10 min. It was found that titanium sulfide is stable to oxidation up to 300°C. Above 300°C it begins to oxidize and at 1200-1250°C it is completely oxidized to TiO_2 in the course of 20-25 min. $ThS_{1.7}$ begins to be oxidized at 500°C and at 1200-1300° it is completely converted to ThO_2 . ThS_2 is stable up to 500°C and at 500°C it begins to be oxidized. Complete oxidation of ThS_2 takes place at 1300-1350°C. In the presence of Cu complete oxidation of titanium and thorium sulfides is observed at 1000-1100°C. On this basis a method was developed for the analysis of these sulfides by decomposing them in the presence of Cu as a catalyst and determining sulfur by titrating the H_2SO_4 , produced during absorption of SO_2 into H_2O_2 . The content of metal in sulfides was determined by heating the samples to a constant weight at 1200-1300°C. Sulfide is converted to oxide. Orig. art. has: 4 tables.

AUTHOR: Godovikov, A.A., Candidate of Geological and Mineralogical Sciences

TITLE: The Method of Contact Prints in Qualitative Analysis (Metod kontaktnykh otpechatkov pri kachestvennom analize)

PERIODICAL: Priroda, 1958, Nr 6, p 88-89 (USSR)

ABSTRACT: The author suggests a new method for making qualitative analyses, i.e., by contact prints. The polished surface of the mineral cut to be tested is placed upon a sheet of chemically treated photo print paper which is spread on a plate covered with tin foil. The mineral and the paper are exposed to pressure in a specially constructed press (Fig. 1) through which an electric current is sent. The paper is then removed and chemically processed, showing the proper color of the respective mineral. This method detects compounds which otherwise are hard to distinguish even under a microscope and shows the distribution of chemical substances in the sample under investigation. (Color plates 1-6). There are 6 photos, 1 figure and 1 Soviet reference.

TITLE: The Specific Nature of the Oxidation Process of Smaltite-Chloanthite (O nekotorykh osobennostyakh protsesa okisleniya shmaltin-khloantita)

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya geologicheskaya, 1958, Nr 10, p 37 - 44 (USSR)

ABSTRACT: One of the characteristic peculiarities of the smaltite-chloanthite mineral is its zonal structure. These zones differ from each other in chemical composition and in their content of cobalt and nickel. Only cobaltic arsenide (skutterudite) is a constant component of all zones. This opinion was long ago expressed by foreign scientists [Ref. 10, 11, 13 and 15] and is now confirmed by chemical tests (Table 2) and by X-ray examinations (Table 3) of thin sections of smaltite-chloanthite taken from the same deposit. The authors describe the procedure adapted for the chemical analyses. The following names are mentioned for work in this field G.G. Lemmleyn, S.A. Ostromyev, and the chemist A.I. Pokrovskaya from the ISEM AS USSR. There are

TITLE: On the Isomorphism Between Sulphur and Tellurium in Galenite

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 127, Nr 2, pp431-434
(USSR)

ABSTRACT: S, Se and Te are in the VIth group of the periodic system of elements and are chemical analogs. In nature they are connected by monotypical hypergenic processes and occur in the same deposits. They are arranged in an isomorphous series in geochemical papers (Refs 1,2,4). The isomorphism of S and Se is undoubtedly, that of S and Te, is, however, unclear. The possibility of an isomorphous substitution of the elements is known to be to a considerable extent caused by the size of the ionic-, atomic-, or covalent radii. The sulphides are to a considerable extent covalent compounds. Selenides and tellurides to a still greater extent. The authors wanted to examine experimentally the boundaries of the isomorphous substitutions between S and Te. For this purpose PbS (gallenite) and PbTe (altaite) were chosen as compounds of one and the same structural type (NaCl) which have also the same type of

Card 1/5

Tellurium in Galenite

SOV/20-127-2-55/70

chemical bond and further analogies. They were produced pyrosynthetically from elements (in stoichiometric quantities). Table 1 shows the lattice parameters and the microhardness in the series of these compounds. The tellurium quantity which penetrated into the galenite lattice was considerably shortened with the reduction of the altaite concentration to 5% (the parameters were much less changed). The parameters were not changed at an altaite content of 2 and 0.25%. This proves the limitedness of the S- and Te-isomorphism. Considerable excess concentrations of Te are necessary for its occurrence. A solid solution is produced here since the microhardness increases with rising content of PbTe in the sample. By a galenite synthesis in the presence of a considerable tellurium excess a mixture was produced consisting on the whole of galenite and tellurium (Fig 4); it had a characteristic structure. The galenite parameter was, however, not changed.

Card 2/3

On the Isomorphism Between Sulphur and
Tellurium in Galenite

Sov/20-127-2-55/70

The formation of a small altaite quantity in the mixture which cannot be determined by the phase analysis may be caused by an inconsiderable sulphur loss in the opening of the soldered experimental ampule. It could not be proved that selenium plays the role of a mediator when tellurium penetrates into the galenite lattice. There are 4 figures, 3 tables, and 5 references, 4 of which are Soviet.

AUTHOR: Godovikov, A.A.

TITLE: X-ray investigation of the individual representatives
of the system Bi-Se

PERIODICAL: Zhurnal strukturnoy khimii, v.3, no. 1, 1962, 44-50

TEXT: The author investigated the Bi Se system by taking x-ray photographs of (a) $Bi_{4.26}Se_3$ and (b) Bi_2Se_3 and comparing the results with literature data for (c) BiSe; (d) Bi_2Se_3 ; (e) metallic Bi; and (f) paraguanaquatite. The present work was aimed at defining the range of solid solutions; the formation of the latter, from BiSe with either Bi or Se, has been shown by N.Kh Abrikosov et al (Ref.3-4: Doklady na soveshchani po issledovaniya diagramm sostoyaniya metallicheskikh sistem, Izd-vo AN SSSR, M., 1956, p. 27 (Papers presented at the Conference for the Study of Equilibrium Diagrams of Metal Systems); Zh. neorg. khimii, 5,9, 2011 (1960), and the existence of a continuous series of solid solutions,

ranging from Bi_2Se_3 to BiSe , has been forwarded by S.A. Semiletov (Ref. 5-6: Tr. Inst. Kristallografii AN SSSR, 10, 76 (1954); Dokl. AN SSSR, 100, 6, 1079 (1955)). Specifically, optically homogeneous samples of annealed $\text{Bi}_{0.7}\text{Se}_7$ and of Bi_2Se_3 were submitted to x-ray analysis, using Cu radiation and a Ni-filter. The parallel tabulation of the x-ray data for all 6 samples showed their great similarity, especially between samples (b), (d) and (f); this is shown by comparison of calculated lattice parameters. A comparison between $\text{Bi}_{4.26}\text{Se}_3$, BiSe , and Bi_2Se_3 showed also that both their respective intensity and d values changed regularly with the change in composition, and that a is almost proportional to the composition. Consequently, the existence of a wide range of solid solutions, ranging from Bi_2Se_3 through BiSe up to $\text{Bi}_{4.26}\text{Se}_3$ was postulated. It was assumed, however, that the actual range may be wider, namely, from Bi_2Se to Bi_2Se_3 . There are 1 table and 15 references. ✓

Title : Barbituric acids. Part 2.- Synthesis of methylene-bis-5-alkenyl barbituric acids
Periodical : Zhur. ob. khim. 24/9, 1572-1575, Sep 1954
Abstract : The reaction between methylene-bis-sodiummalonic ester with primary unsaturated chlorides - allyl chloride and methallyl chloride - , was investigated. The synthesis of hitherto unknown methylene-bis-5-allylbarbituric acid, methylene-bis-5-methallylbarbituric acid and 5-secondary-pentenylbarbituric acid, is described. The behavior of alkenyl allyl halides in this reaction was found to be similar to that of alkyl halides. The secondary reaction, namely, the splitting of the intermediate product, which takes place during allylation or alkylation of the methylene-bis-malonic ester is analyzed. ✓ Barbituric acids. IV. Synthesis of spirobarbituric acid. J. L. Y. Levina, N. N. Godovikov and F. K. Valichku (Zh. obshch. Khim., 1955, 25, 2322-2327).—In an earlier investigation methylenemalonic ethers were reacted with cyclopentadiene and cyclohexadiene. Saturated and unsaturated spirobarbituric acids were obtained, containing endomethylenic or endoethylenic bridges in carbocyclic radicals. Further study was made of reactions between methylenemalonic ethers and diene hydrocarbons with open chains of carbon atoms, e.g., penta-1 : 3-diene, isoprene and 2 : 4-dimethylpent-1 : 3-diene. In the usual conditions of diene synthesis, the following were obtained: 1 : 1-dicarboxy-2-methyl-, 1 : 1-dicarboxy-4-methyl- and 1 : 1-dicarboxy-2 : 2 : 4-trimethylcyclohex-3-one, in yields of 25, 27 and 24%, respectively, showing that in all conditions of diene synthesis methylenemalonic ethers behave as dienophiles. With alkadienes of different configuration, under the same conditions, adducts are formed of similar characteristics but in low yields. Esters of cyclohexene- and cyclohexanemalonic acids behave in the manner of disubstituted malonic esters and are transformed by urea in the presence of NaOEt into barbituric acids of *spiro-form*. It was noted that strong dienophiles like malonic anhydrides react with penta-1 : 3-diene with less ease than with isoprene and not at all with 2 : 4-dimethylpenta-1 : 3-diene, indicating that methylmalonic ethers are stronger dienophiles than malonic anhydrides. TITLE:

Insecticides of Organophosphorus Compounds - Some
Derivatives of Methylthiophosphinic- and Methyldithio-
phosphinic Acid (Fosfororganicheskkiye insektitsidy,
nekotoryye proizvodnyye metiltiofosfinoy i
metilditiofosfinoy kislot)

PERIODICAL:

Zhurnal obshchey khimii, 1958, Vol. 28, Nr 6, pp.
1568 - 1573 (USSR)

ABSTRACT:

The majority of phosphorus organic insecticides are derivatives of thiophosphoric-, dithiophosphoric- and pyrophosphoric acids (Refs 1 - 3). In publications also a few insecticides are described which are derivatives of phosphinic- and dithiophosphinic acids; among them are the methylphosphinates and methylthiophosphinates. The latter contain substituted aryl groups (Ref 4), the ethylxanthoyl-group, as well as other groups (Refs 4,5) and the O-ethyl-O-p-nitrophenylester of phenylthiophosphinic acid ("E.P.H.") (Ref 6). This ester is the only insecticide

of the series of thiophosphinic acids which is of practical importance. Therefore it was of interest to the authors to synthesize derivatives of alkylthio- and alkyldithiophosphinic acids which have ester groupings analogous to those of well-known insecticides of thiophosphoric- and dithiophosphoric acid. The authors obtained from the dichloroanhydride of methylthiophosphinic acid the chloroanhydrides of the acid esters of methylthiophosphinic acid with methoxy-, ethoxy- and propoxygroups. Derivatives of methylthiophosphinic- and methyldithiophosphinic acid with groupings corresponding to well-known insecticides (Tiofos, Metafos, Karbos, Potazan and Sistoks) were synthesized. The insecticide properties of the synthesized compounds were investigated in the laboratory using the autumn bugs on the plant "Eurygaster intergriceps Put" as well as the fullgrown caterpillars on the plant "Tseudococcus maritimus Ehrh". The insecticide effect of the mentioned synthesized compounds did not correspond to the activity of the known insecticides.

the Thio- and Dithiophosphoric Acids Containing a β -Ethyl Mercapto Ethyl
Grouping

Card 2/3

insecticides of phosphoric acid have only a weak contact- and a strong vegetative effect. Some of them are used in practical applications (Ref 8). On the other hand, it was of interest to examine this activity in the amido esters of thiophosphoric and dithiophosphoric acid with a β -ethyl mercapto ethyl grouping since it could be assumed that they would also show a strong vegetative activity. These esters have hitherto remained unknown with few exceptions (Refs 11, 12). The compounds (I), (II), and (III), the first two of which were obtained as acid chlorides according to scheme 3, were used as initial products for these amido esters. In reacting the above acid chlorides with β -oxydiethyl sulphide in the presence of powder sodium hydroxide the thiophosphates (Gd-50), (Gd-52), and (Gd-64) (Scheme 4) resulted. The compounds obtained were isomerized into the thiophosphates (Gd-53), (Gd-54), and (Gd-66) at 160-170° during 8-10 hours (Scheme 5). Moreover, the thio-phosphates (Gd-55) and (Gd-56) were synthesized by the reaction according to scheme 6. The constants and yields of the new insecticides are listed in table 1 (details are given in the

Organophosphorous Insecticides. VI. Amidoesters of the SOV/79-29-7-19/83
Thio- and Dithiophosphoric Acids Containing a β -Ethyl Mercapto Ethyl Grouping

experimental part and in tables 2 and 3). In heating tetra-methyl diamidochlorophosphate with P_2S_5 tetramethyl diamido-thiophosphate is formed by replacement of the oxygen atom by sulphur. Some amido esters such as (Gd-53), (Gd-54), and (Gd-56) show a vegetative activity against spinning-mites. There are 3 tables and 17 references, 11 of which are Soviet.

TITLE: Anticholinesterase properties of O,O-diethyl S-(2-(methylamino)-ethyl thiophosphates and their methylsulfonium methyl sulfates

SOURCE: AN BSSR. Doklady, v. 163, no. 2, 1965, 365-368

TOPIC TAGS: nerve gas, chemical warfare agent, cholinesterase inhibitor, anti-cholinesterase activity, thiophosphate ester

ABSTRACT: One of the most effective ways to increase the activity of organophosphorus cholinesterase inhibitors is to introduce an onium group in their structure at the same distance from the phosphoryl group as the distance between the carbonyl carbon and the quaternary nitrogen in acetylcholine. Previous work showed that the sharp increase in anticholinesterase activity observed on transition from sulfides $\text{CH}_3(\text{C}_2\text{H}_5\text{O})\text{P}(\text{O})\text{SCH}_2\text{CH}_2\text{SC}_2\text{H}_5$ to sulfonium compounds $[\text{CH}_3(\text{C}_2\text{H}_5)_3\text{P}(\text{O})\text{SCH}_2\text{CH}_2\text{S}(\text{CH}_3)\text{C}_2\text{H}_5]^- \text{SO}_4^-\text{CH}_3$ is due not to the inductive effect, but to the formation of an ionic bond between the inhibitor and the anionic center of cholinesterase. The effect of the magnitude of the effective cation charge on the anticholinesterase activity of the

above compounds was investigated. The compounds investigated were O,O -diethyl S-(β -aryl methyl-amino)-ethyl thiophosphates ($\text{C}_2\text{H}_5\text{O})_2\text{P}(\text{O})\text{SCH}_2\text{CH}_2\text{N}(\text{CH}_3)\text{C}_6\text{H}_4\text{R}$, and their methylsulfonium methyl sulfates [$(\text{C}_2\text{H}_5\text{O})_2\text{P}(\text{O})\text{SCH}_2\text{CH}_2\text{N}(\text{CH}_3)\text{C}_6\text{H}_4\text{R}\text{HSO}_3\text{CH}_3$. Aryl substituents R of different electronegativities were used: CH_3 , Cl , OCH_3 . Anticholinesterase activity was evaluated from the reaction rate constants of inhibitors with serum cholinesterase (acylcholine hydrolase) in M/50 phosphate buffer (pH 7.5) at 25°C. The physical constants of the inhibitors and their reaction rate constants are given in tabular form. In compounds with a ternary N, the presence of aryl groups decreases anticholinesterase activity, presumably because of the lesser ability of aromatic amines to form ammonium cations in aqueous solution. On the other hand, compounds with a quaternary N and aryl groups show very strong activity. In addition to increasing the effective positive charge, the hydrophobic aryl radicals facilitate the sorption of the inhibitor on the enzyme surface. The existence of the positive charge appears to be the most important factor determining the high activity of such inhibitors. The nature of the substituents R, showing good linear correlation with the reaction rate, and the steric compatibility of the aryl group with the anionic site of the enzyme are of secondary importance. Orig. art. has: 2 tables and 1 figure.
